Small Changes, Big Changes: An Updated View on the Android Permission System

Yury Zhauniarovich
Olga Gadyatskaya

Sensitive Resource Protection in Android

- Android is the most popular mobile OS:
 - ~ 2 billion of third-party apps only on Google Play
 - many more markets exist
 - **a lot** of malware/adware/greyware/...
- The end users can control access of third-party apps to their sensitive data via **permissions**
- Permissions is a general way how access to sensitive resources is controlled on Android

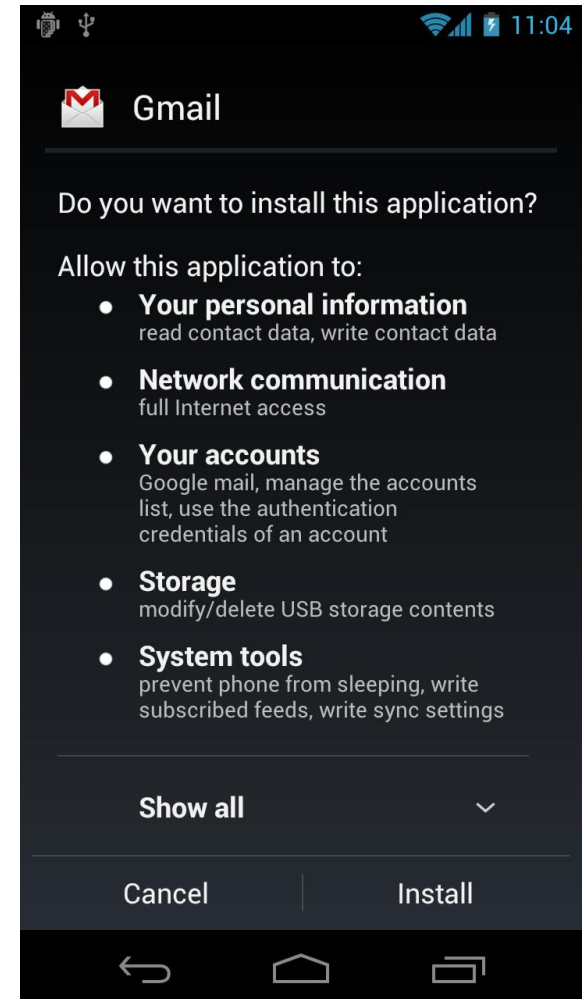

Android Permission System

- **Android Permission** is a security label assigned to a sensitive resource that protects the access to this component. Once an app is granted with the permission it receives access to the corresponding resource
- Permissions may belong to a **permission group**, a category of permissions protecting similar functionality
- Permissions are declared in **AndroidManifest.xml** files
- Permissions:
 - **Platform** – defined within the sources of Android protecting **the components of the operating system**
 - **Custom** – declared by third-party developers protecting **the resources of the application**

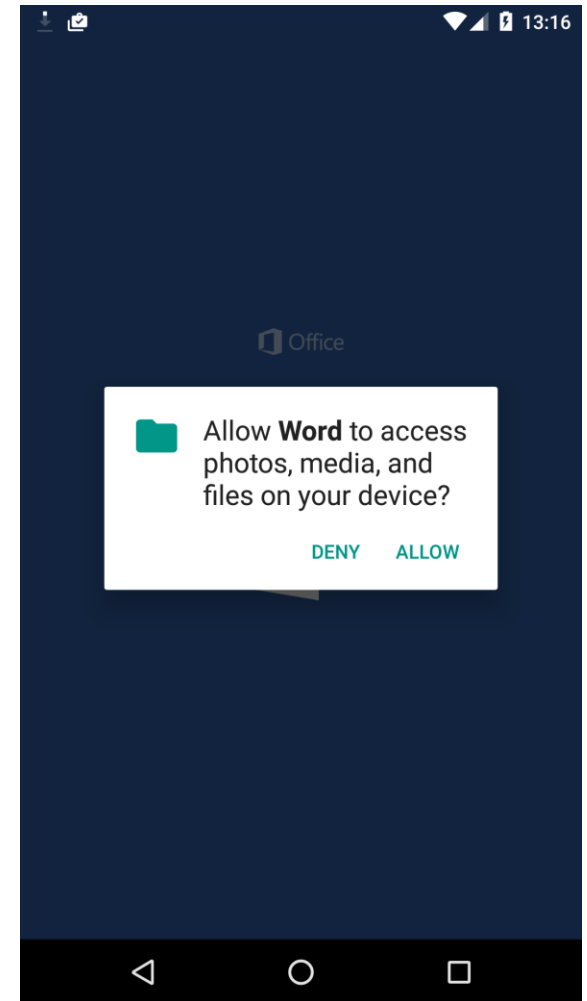

Established View on the Permission System

- All permissions are granted at the installation time or the application is not installed
- Granted permissions cannot be revoked
- There are 4 protection levels:
 - **normal** (granted automatically)
 - **dangerous** (granted after user's approval)
 - **signature** (granted only if the packages declaring and requesting permissions are signed with the same certificate)
 - **signature/system** (similar to signature, but also granted if the application is installed on the system image)
- Only dangerous permissions are approved by the user

Updated View on the Permission System (23+)

- Permissions:
 - **Installation time** (normal, signature, signature|system)
 - **Runtime** (dangerous)
- Installation time permissions are granted at install and cannot be revoked
- Runtime permissions are disabled by default, granted when required (according to an app developer) and can be revoked

Motivation

- Permission system is a central component for the Android security
- Permissions are used in many research articles exploring the Android security
- The detailed exploration of the Android permission system for the scientific community has been done in 2009 (“Understanding Android Security” by W. Enck et al.)
- In Android 6.0 (Marshmallow), the permission model has been considerably changed

Our Approach

- We analyzed 16 versions of Android resulted in API change (from 1.6 [Donut] up to 6.0 [Marshmallow])
- We developed scripts:
 - to extract declared permissions and their properties from the manifest files
 - to compare the extracted data for different versions of Android
- We applied our software to the considered versions and performed *quantitative* and *qualitative* analysis of the changes
- In this work we concentrated on the **platform permissions**
- We divide platform permissions into: ***core, package, sample, test***

BONUS:

- For this presentation, we also included the analysis of Android 7.0 [Nougat] released on August 22, 2016

Permission Declaration

```
<!-- Allows an application to send SMS messages.
    <p>Protection level: dangerous
-->
<permission android:name="android.permission.SEND_SMS"
    android:permissionGroup="android.permission-group.SMS"
    android:label="@string/permlab_sendSms"
    android:description="@string/permdesc_sendSms"
    android:permissionFlags="costsMoney"
    android:protectionLevel="dangerous" />
```

Permission Declaration

```
<!-- Allows an application to send SMS messages.
```

```
    <p>Protection level: dangerous
```

```
-->
```

```
<permission android:name="android.permission.SEND_SMS"  
    android:permissionGroup="android.permission-group.SMS"  
    android:label="@string/permlab_sendSms"  
    android:description="@string/permdesc_sendSms"  
    android:permissionFlags="costsMoney"  
    android:protectionLevel="dangerous" />
```

Permission Declaration

```
<!-- Allows an application to send SMS messages.
```

```
    <p>Protection level: dangerous
```

```
-->
```

```
<permission android:name="android.permission.SEND_SMS"  
    android:permissionGroup="android.permission-group.SMS"  
    android:label="@string/permlab_sendSms"  
    android:description="@string/permdesc_sendSms"  
    android:permissionFlags="costsMoney"  
    android:protectionLevel="dangerous" />
```

Permission Declaration

```
<!-- Allows an application to send SMS messages.
```

```
    <p>Protection level: dangerous
```

```
-->
```

```
<permission android:name="android.permission.SEND_SMS"  
    android:permissionGroup="android.permission-group.SMS"  
    android:label="@string/permlab_sendSms"  
    android:description="@string/permdesc_sendSms"  
    android:permissionFlags="costsMoney"  
    android:protectionLevel="dangerous" />
```

Permission Declaration

```
<!-- Allows an application to send SMS messages.
```

```
    <p>Protection level: dangerous
```

```
-->
```

```
<permission android:name="android.permission.SEND_SMS"  
    android:permissionGroup="android.permission-group.SMS"  
    android:label="@string/permlab_sendSms"  
    android:description="@string/permdesc_sendSms"  
    android:permissionFlags="costsMoney"  
    android:protectionLevel="dangerous" />
```

Implementation Details

PermissionInfo.flags
parsed from
android:permissionFlags

PermissionInfo.protectionLevel
parsed from
android:protectionLevel

Quantitative Analysis

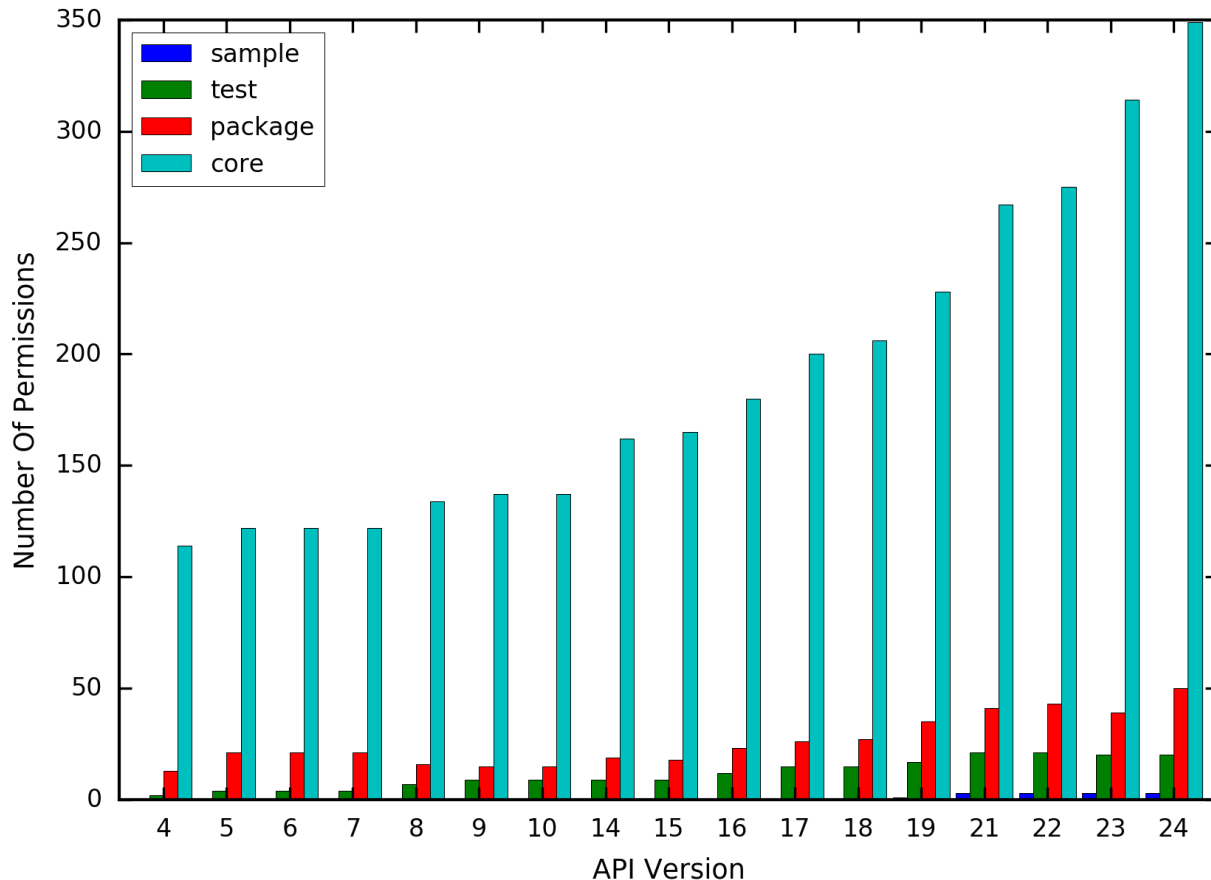

معهد قطر لبحوث الحوسبة

جامعة حمد بن خليفة
HAMAD BIN KHALIFA UNIVERSITY

Permission Amount of Different Manifest Types

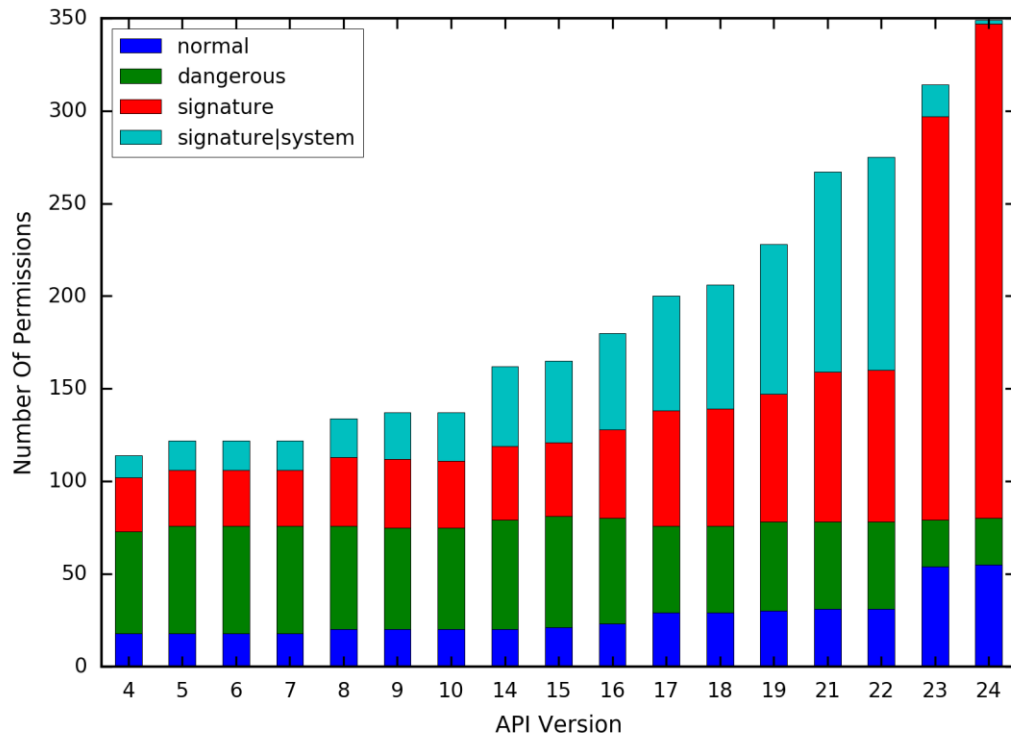

- Number of core permissions is considerably higher than others
- Permission number grows:
 - New platforms (TV, Auto)
 - New packages (Launcher3, etc)
 - Old packages are not removed (e.g., Launcher2)

Permission Amount of Different Manifest Types

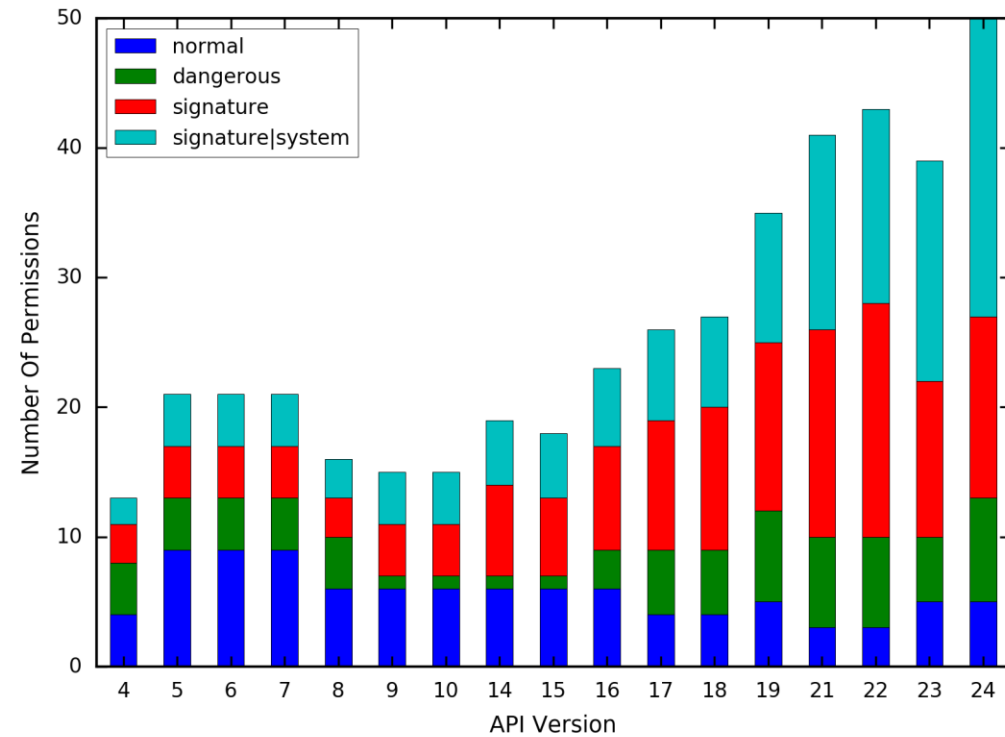

- Number of core permissions is considerably higher than others
- Permission number grows:
 - New platforms (TV, Auto)
 - New packages (Launcher3, etc)
 - Old packages are not removed (e.g., Launcher2)

Permission Number of Different Protection Levels

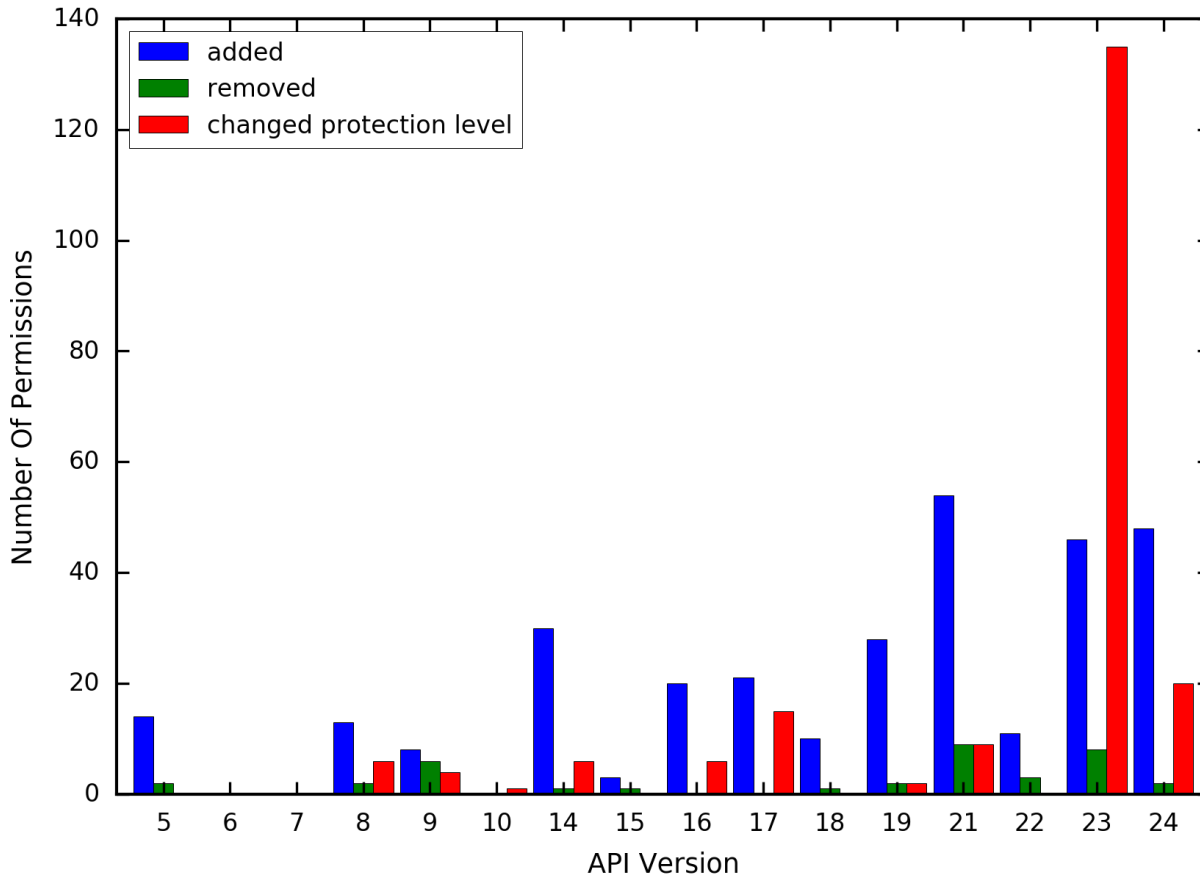

Core

Package

Analysis of Permission Number Changes

- Android 6.0 (API 23) – signature|system is deprecated

Amount of Permission Groups

- Android 6.0 (API 23) – permissions are granted on **per group** basis

Qualitative Analysis

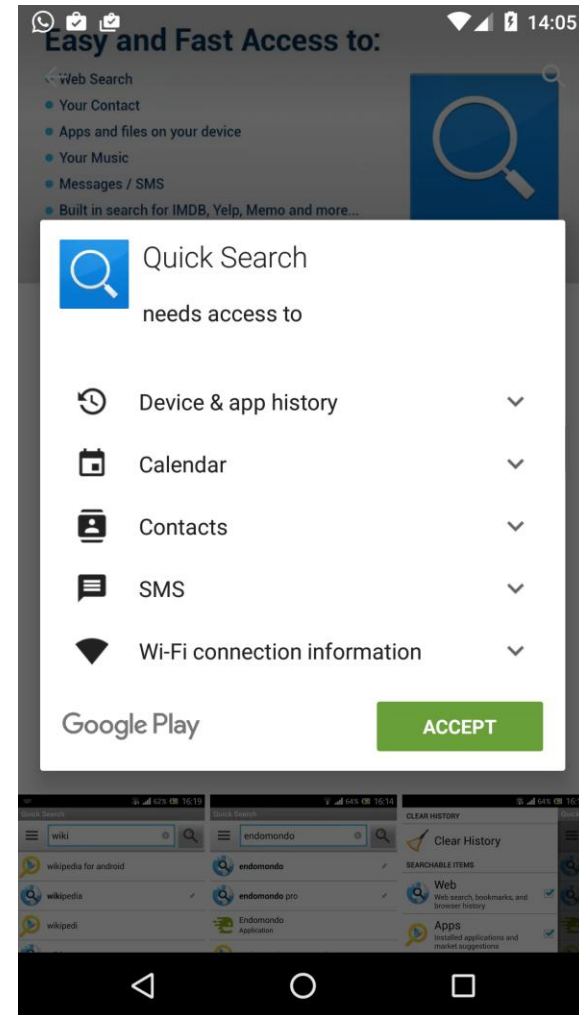

معهد قطر لبحوث الحوسبة
Qatar Computing Research Institute

جامعة حمد بن خليفة
HAMAD BIN KHALIFA UNIVERSITY

Important Changes

- Runtime permissions
 - User can revoke runtime permissions
 - Granted per permission group
- Not uniform behavior of apps:
 - Backward compatibility of old apps with the new platform
 - Old style installation process (all permissions are granted)
 - Permissions are granted and revoked through AppOps system
 - Only core permissions are “truly” runtime
 - Forward compatibility of new apps with older platforms
 - Developers must add additional checks for some permissions (e.g., WRITE_CALL_LOG, READ_CALL_LOG, READ_EXTERNAL_STORAGE)

Important Changes

- UID sharing:
 - Changes of runtime permission in one application influence on the permission state in other application
- Signature permissions can be requested by third-party apps:
 - Appop permissions can be granted by the user (PACKAGE_USAGE_STATS, SYSTEM_ALERT_WINDOW, WRITE_SETTINGS)
 - Development permissions can be granted to third-party applications through “pm grant” command
 - Permissions with FLAG_PRE23 set are granted automatically to apps with the target SDK level below 23
- Some dangerous permissions are now normal:
 - Some highly sensitive dangerous permissions are now normal (e.g., INTERNET, NFC, BLUETOOTH, etc.)

Summary

- Permission system is far from being stable
- Amount of permissions grows with every new release
- Considerable changes in Android Marshmallow
- Permission changes protection level often => security researchers must acknowledge this in their tools

Thank you!
